

REFLEXfree v1.1

VST Ambience generator

REFLEXfree is capable of generating huge spaces or chorus like modulations through a cascade of regenerating delays. It's sound is a mixture of straight stereo delays followed by a dense cloud of reflections. It achieves a huge and spacey wideness with a decent amount of modulation.

Features:

- short reflections up to endless reverberation
- Delay/Reverb Modulation
- Two modulation shapes
- lean GUI
- Low on CPU

Controls:

- | | |
|-------------|---|
| 1 - Input: | Input level |
| 2 - Mix: | Crossfade between dry Input and 100% wet Signal. |
| 3 - Size: | Overall delay time factor. Delay times vary between 10ms and 500ms at 44.1kHz samplingrate. |
| 4 - Damp: | A HiCut and a Lo Cut Filter in the feedback loop. |
| 5 - Decay: | The feedback amount of regenerating delay loops. |
| 6 - Rate: | Frequency of the modulating LFO. Range is from 0.002Hz up to 8 Hz. |
| 7 - Depth: | Modulation Depth of the LFO on the delay times. |
| 8 - Switch: | (Modulation shape) That switch changes between a normal sin shape (left) and an alternating sin like function (right), which results in a less static modulation. |
